Computational Subsurface Hydrology - Reactions, Transport, and Fate

Gour-Tsyh (George) Yeh

Computational Subsurface Hydrology - Reactions, Transport, and Fate Gour-Tsyh (George) Yeh

Any numerical subsurface model is comprised of three components: a theoretical basis to translate our understanding phenomena into partial differential equations and boundary conditions, a numerical method to approximate these governing equations and implement the boundary conditions, and a computer implementation to generate a generic code for research as well as for practical applications. *Computational Subsurface Hydrology: Reactions, Transport, and Fate* is organized around these themes.

The fundamental processes occurring in subsurface media are rigorously integrated into governing equations using the Reynolds transport theorem and interactions of these processes with the surrounding media are sophisticatedly cast into various types of boundary conditions using physical reasoning. A variety of numerical methods to deal with reactive chemical transport are covered in *Computational Subsurface Hydrology: Reactions, Transport, and Fate* with a particular emphasis on the adaptive local grid refinement and peak capture using the Lagrangian-Eulerian approach. The topics on coupled fluid flows and reactive chemical transport are unique contributions of this book. They serve as a reference for research as well as for practical applications with a computer code that can be purchased from the author.

Four computer codes to simulate vertically integrated horizontal solute transport (LEMA), contaminant transport in moving phreatic aquifers in three dimensions (3DLEMA), solute transport in variably saturated flows in two dimensions (LEWASTE), and solute transport under variably saturated flows in three dimensions (3DLEWASTE) are covered. These four computer codes are designed for generic applications to both research and practical problems. They could be used to simulate most of the practical, real-world field problems.

Reactive chemical transport and its coupling with fluid flows are unique features in this book. Theories, numerical implementations, and example problems of coupled reactive transport and flows in variably saturated media are presented. A generic computer code, HYDROGEOCHEM 3.0, is developed. A total of eight example problems are used to illustrate the application of the computational model. These problems are intended to serve as examples for setting up a variety of simulations that one may encounter in research and field-site applications.

Computational Subsurface Hydrology: Reactions, Transport, and Fate offers practicing engineers and scientists a theoretical background, numerical methods, and computer codes for modeling contaminant transport in subsurface media. It also serves as a textbook for senior and graduate course on reactive chemical transport in subsurface media in disciplines such as civil and environmental engineering, agricultural engineering, geosciences, soil sciences, and chemical engineering.

Computational Subsurface Hydrology: Reactions, Transport, and Fate presents a systematic derivation of governing equations and boundary conditions of subsurface contaminant transport as well as reaction-based geochemical and biochemical processes. It discusses a variety of numerical methods for moving sharp-front problems, expounds detail procedures of constructing Lagrangian-Eulerian finite element methods, and describes precise implementation of computer codes as they are applied to subsurface contaminant transport and biogeochemical reactions.

From reader reviews:

Mora Miller:

Why don't make it to be your habit? Right now, try to ready your time to do the important work, like looking for your favorite reserve and reading a publication. Beside you can solve your condition; you can add your knowledge by the publication entitled Computational Subsurface Hydrology - Reactions, Transport, and Fate. Try to the actual book Computational Subsurface Hydrology - Reactions, Transport, and Fate as your close friend. It means that it can to get your friend when you experience alone and beside that of course make you smarter than previously. Yeah, it is very fortunated for yourself. The book makes you much more confidence because you can know everything by the book. So , let us make new experience in addition to knowledge with this book.

Daniel Butler:

Reading a e-book tends to be new life style within this era globalization. With reading through you can get a lot of information that may give you benefit in your life. Using book everyone in this world may share their idea. Ebooks can also inspire a lot of people. Plenty of author can inspire their reader with their story as well as their experience. Not only the storyplot that share in the guides. But also they write about the data about something that you need case in point. How to get the good score toefl, or how to teach your kids, there are many kinds of book that you can get now. The authors in this world always try to improve their expertise in writing, they also doing some exploration before they write with their book. One of them is this Computational Subsurface Hydrology - Reactions, Transport, and Fate.

Curtis Monahan:

The book untitled Computational Subsurface Hydrology - Reactions, Transport, and Fate contain a lot of information on this. The writer explains the woman idea with easy method. The language is very straightforward all the people, so do not necessarily worry, you can easy to read this. The book was published by famous author. The author brings you in the new era of literary works. You can read this book because you can please read on your smart phone, or gadget, so you can read the book in anywhere and anytime. In a situation you wish to purchase the e-book, you can open up their official web-site in addition to order it. Have a nice go through.

Tammie Torres:

Reading a publication make you to get more knowledge from that. You can take knowledge and information from the book. Book is created or printed or descriptive from each source which filled update of news. In this particular modern era like at this point, many ways to get information are available for anyone. From media social just like newspaper, magazines, science book, encyclopedia, reference book, fresh and comic. You can add your understanding by that book. Are you hip to spend your spare time to spread out your book? Or just seeking the Computational Subsurface Hydrology - Reactions, Transport, and Fate when you needed it?
